

Creating a new site – with a “page not found” result.

Here is the setting page.

Home > Administer > Site configuration

Multisite Manager settings

Defaults settings.php help

These defaults will need corresponding changes in settings.php. Consult help for other required changes on the file system. [\[more help...\]](#)

Run drupal sites' cron jobs
This sets whether each drupal site's cron jobs will be run when this master site's cron is run. If this is unset no drupal site will have their cron jobs executed regardless of each individual sites' settings for running cron jobs.

Install site upon node creation
This sets whether Drupal site's creation is done upon node creation or whether it is delayed until the batch create script is run.

Table prefix default:

This is the default prefix that will be forced on those without "advanced database setup" rights. {shortname} stands for the shortname field input when creating the site. If you make the default database different from the current one, you can reasonably make this empty.

Database name default:

If left blank, it will use the current database. Otherwise, "{shortname}" will be replaced, so another common default might be "{shortname}_drupal". Do NOT set this unless the current database account has CREATE access in MySQL or CREATEDB access in Postgres. To ensure database data is not overwritten, if you install in another database, it is either required that your current database have some db_prefix OR that it will be a new database--i.e. that your entry here includes "{shortname}".

Link default:

This is where the site will be accessible by default. If you setup your ./sites/default/settings.php correctly along with your web server (e.g. apache/htaccess) config, you can anticipate where the new site will live and forward the user to the new site location upon creation. Here, there are two dynamic variables, {base_url} and {shortname}.

Admin account on new sites: *

Copy the admin account from this site
 Copy the account of the creator
 Do nothing (only choose this if all profiles available do something instead, the default profile does not)

Profile default:

Drupal: Select this profile to enable some basic Drupal functionality and the default theme.

Create Drupal Site

Title: *

computer science

Shortname: *

cse

This short name will be used in the database as a unique identifier and also possibly the default site location. This must only be numbers and letters

Profile: *

Drupal: Select this profile to enable some basic Drupal functionality and the default theme.

Run Drupal Sites' Cron

This sets whether this drupal site's cron jobs will be run when the master site's cron is run and is configured to trigger sites. By default, it is set ON only if the master is configured to trigger sites.
